3 Most Important Tips to Make the Most
Kick Butt
Huna Libraries

A Huna library's value often boils down to how its author constructed it. Whether your goal is to be the most subscribed-to library builder on Huna, or you simply want to create a useful tool for others to share, these tips will help you to create true value as opposed to a page full of underlined words.

1

Render Only When Necessary: No one wants to view an article with too many useless records rendering. Good libraries capture content that is unique enough to render only when useful.

✓ Choose unique enough library *"search terms"* to maximize the chance that it properly renders useful information to the user.

✗ Create libraries with such common *"search terms"* that they might render too often and provide little value (e.g. "https", "www", "the", "of", "Bob").

2

Render Sufficiently: Huna should recognize records whenever they emerge in the proper context of editing / reading.

✓ Create complete libraries – if you create a library for U.S. States – be sure to have records for all 50 states. Use the *"Complete Record Title"* field to help clarify duplicative records.

✗ Create incomplete libraries – doing so will mislead users who expect Huna to render according to your library title and description. Overlook the *"Complete Record Title"* field.

3

Render Insightfully: Libraries should provide information that interested users find useful and, without Huna, would typically search.

✓ Ask yourself – if this record popped up for me, would I care about the content displayed? For "Colorado" do I care more about the State flower or microbrewery reviews?

✗ Create libraries with content purely based upon the ease of gathering record data. Huna's purpose is to reduce the time and effort to gather content that users would actually search.
