

Typing Interrupt

On a small subset of devices, most notably the Microsoft Surface line of products, some users experience occasional stutters in performance while typing, resulting in missed characters. This stutter or “Typing Interruption” is caused by an API (Application Programming Interface) limitation with Microsoft Office. Microsoft has plans to develop a new API that will fix this issue.

In the meantime, there are a few things you try to fix this issue on your device:

- Use the browser-based version of Office/Word/Outlook/PowerPoint (go to <https://office.com>)
- -OR- in you Huna Add-In, click Settings > Autosearch (toggle off)

When the new API becomes available, we will promptly update Huna to resolve this issue.
